EXPERIMENT – 2

SETTING UP ZOHO CREATOR ACCOUNT AND EXPLORING THE PLATFORM ARCHITECTURE AND INTERFACE

AIM

To create and configure a Zoho Creator account and explore the platform architecture, development environment, interface, and major components used for low-code application development.

PROCEDURE

1. Open the official Zoho Creator website and access the Zoho Creator platform.
2. Create a Zoho account or sign in using an existing Zoho account.
3. Access the Zoho Creator home page and explore the application development dashboard.
4. Create a new application using the available application creation options.
5. Explore the main components of the Zoho Creator development environment, including:
   • Applications
   • Forms
   • Reports
   • Pages
   • Workflows
   • Schedules
   • Functions
   • Integrations
6. Explore the application builder interface and identify the navigation panel, workspace, configuration options, and development tools.
7. Examine the relationship between the major components of the platform. Forms are used to collect data, reports are used to display data, pages are used to create customized interfaces, and workflows are used to automate processes.
8. Explore the settings and application configuration options available for managing the application.
9. Save the created application and verify that the application can be accessed from the Zoho Creator dashboard.

PLATFORM ARCHITECTURE

The basic architecture of Zoho Creator consists of the following layers:

• User Interface Layer – Provides forms, pages, reports, and dashboards for users.

• Application Layer – Handles application logic, workflows, functions, and automation.

• Data Layer – Stores and manages application data collected through forms.

• Integration Layer – Enables communication with external applications and services.

• Automation Layer – Executes workflows, schedules, and other automated processes.

RESULT

Thus, a Zoho Creator account was successfully created and configured. The Zoho Creator platform architecture, application development environment, interface, and major components were explored and their roles in low-code application development were understood.
